Day # 13 – Apex Implementation Best Practices

ABC Containers require the ability to automatically associate a Contact created in their Salesforce Instance with the respective Account based on the email domain specified in the primary email address of the Contact. The association should happen real time as soon as a Contact record is created within the system.

TODO:

- Ensure all the discussed implementation best practices are followed.
- Develop the necessary piece of Apex code to implement a solution for the given problem statement.
- Develop the necessary Test code to attain the right code coverage (minimum 90% with at least 4 test cases)
